

Complete Internet Management. *Deployed in minutes!*

Easy web management

Filter

Billing

Reports

Proxy and Cache

High Speed Database

Secure OS

Complete stack

NetFox includes all aspects of web access management in a single box – from a solid Linux base to an advanced, yet easy-to-use web interface. And what's more, it's kept up to date for you with automatic nightly updates to all components of the system.

Easy deployment options

NetFox comes as a hardware appliance or as a VMware Virtual appliance ready for insertion into a VMware cluster. Power it up and you're ready to go.

Reporting. Billing. Filter. Proxy.

Advanced Reporting

NetFox's browser-based reports provide simple summary views that can quickly drill-down to more detailed information. For example, view the most popular websites for an organisation then, with a single click, view the users that have accessed one of those sites. You can even share reports with management, teaching staff or other users, which allows IT administrators the freedom to focus on other work.

NetFox reporting works in real-time. All traffic is processed as-it-happens and logged to an SQL database. An advanced reporting optimiser means that you get reports that are both accurate to within the last few seconds and quick to generate.

Intelligent Content Filtering

NetFox doesn't just filter URLs. It filters actual page content as well. This means that filtering is more accurate and can react to the constantly changing web. It's also fast – users do not notice a decrease in access speeds when filtering is enabled.

Unlike traditional content filters, NetFox can help stop access to proxy sites as well as video or social networking sites. What's more, you don't have to block entire domains to block a site, NetFox can automatically block pages that are inappropriate while still allowing access to other pages from that domain.

Flexible Billing

With NetFox it's easy to charge your users for Internet access. Simply assign a quota of a few dollars or so, either by group or user and set a charge rate. You can even allow users to recharge their accounts with one of our coin or note loaders.

But it doesn't stop there. You can assign different charge rates for different circumstances. For example, a school might allow free access to all .edu sites. Or, a business might charge higher rates specifically for downloads of MP3 files. And even if you don't want to actually charge your users, it's nice to know how much Internet access is costing you!

Efficient Proxy and Cache

Why pay for a separate proxy and cache as well as your content filter or reporting software? NetFox includes the industry leading Squid proxy cache, used by businesses, universities and schools across the world. NetFox makes your proxy easy to manage and keep up to date. Plus, it reduces your total cost of ownership by including all the necessary tools on the one system for the one price.

NetFox can even be clustered for large environments for redundancy or speed. It has been developed with performance and scalability in mind, and will scale to almost any size.
