

NetFox is a new way to manage your school Internet.

Are you concerned about?

Students accidentally stumbling across pornography on-line?

On-line predators or "e-Bullying" on social networking sites such as myspace?

Administration overhead due to Internet related student requests?

Distractions such as on-line games, myspace, email, chat or download sites for students during class?

Ever rising costs due to excessive or unchecked Internet usage?

What is NetFox?

NetFox is designed to provide a safe learning environment for your school. It keeps students on task and protected from illegal, offensive or inappropriate material while at school. Combining advanced, easy-to-use reporting, accounting and intelligent content filtering on an appliance platform, NetFox sets the pace globally for school Internet management software.

With NetFox you can:

- See what your users are accessing, how long they are doing it, and how much it costs.
- Filter inappropriate sites by examining every page - stop porn, on-line shopping, games and myspace.
- Gain management reports by year level and student or staff member.
- Optionally charge students for their usage or implement quotas.

Since implementing NetFox we have been impressed with not only its ability to handle the volume of Internet requests but, just as significantly, the dependability and flexibility of its filtering system. NetFox reporting gives a precise account, in real-time, of what is being accessed and by whom.

Kevin Richardson, Principal, Immanuel College
